Under the Guidance of

Mr. Adarsh Dubey

ZSCT's Thakur Shyamnarayan Degree College

Academic Year – 2025-26

Lagdu Singh Charitable Trust's (Regd.)
THAKUR SHYAMNARAYAN DEGREE COLLEGE
PROFESSIONAL DEGREE COURSES
Approved by Govt. of Maharashtra, Affiliated to University of Mumbai
NAAC Accredited Grade 'A' (1st cycle) & ISO 9001:2015 (Certified)
(Institute Code No. 1019)

Certificate

I hereby certify that Mr./Ms. Arshiya Dilawar Chaudhary, Student of ZSCT's Thakur Shyamnarayan Degree College studying in SY Bachelor's in Data Science, has completed a project titled Field Analysis of Data Analytics Tools used by HR Professionals specialization for the academic year 2025-2026. To the best of my knowledge the work of the student is original and the information included in the project is correct.

Internal Guide

Head of the Department

Principal

Declaration

I, Mr./Ms. Arshiya Dilawar Chaudhary Student of ZSCT's Thakur Shyamnarayan Degree College studying in SY Bachelor's in data science, hereby declare that I have completed the field project entitle Field Analysis of Data Analytics Tools used by HR Professionals during the academic year 2025-2026.

The report work is original and the information/data included in the report is true emerging from the primary and/ secondary data gathered and analyzed as part of this project.

Due credit is extended on the work of Literature/Secondary Survey by endorsing it in the Bibliography as per prescribed format.

Signature of the Student with Date

Name of Student

Arshiya Dilawar Chaudhary

ACKNOWLEDGMENT

To list who all have helped me is difficult because they are so numerous and the depth is so enormous.

I would like to acknowledge the following as being idealistic channels and fresh dimensions in the completion of this project.

I take this opportunity to thank the **University of Mumbai** for giving me the chance to do this project.

I would like to thank my **Principal, DR. G.D. GIRI** for providing the necessary facilities required for completion of this project.

I take this opportunity to thank our **Coordinator Mrs. Gayatri Bakhtiani**, for his moral support and guidance.

I would also like to express my sincere gratitude towards my project guide, **Mr. Adarsh Dubey** whose guidance and care made the project successful.

I would like to thank my College Library, for having provided various reference books and magazines related to my project.

Lastly, I would like to thank each and every person who directly or indirectly helped me in the completion of the project, especially my Parents and Peers who supported me throughout my journey.

Abstract

This report presents analytical study on titled “Field Analysis of Data Analytics Tools used by HR Professionals.” This study examines the adoption and impact of data analytics tools among HR professionals in modern organizations. Using responses from 170 participants collected via Google Forms, the research analyzed relationships between role, experience, company size, and training needs through Python-based statistical tools and Chi-square tests. Results showed no significant link between role or experience and tool adoption, but a notable correlation between company size and the need for analytics training ($p = 0.0228$). Larger organizations displayed greater readiness and investment in analytics development. Visual and dashboard analyses highlighted gaps in adoption and training access. The study underscores the importance of analytical literacy in HR and recommends enhanced training, tool integration, and scalable solutions to strengthen data-driven decision-making across all organizational levels.

Title

Field Analysis of Data Analytics Tools used by HR Professionals

Introduction:

In today's data-driven world, the role of Human Resource (HR) professionals is rapidly evolving from administrative functions to strategic decision-making based on insights derived from data analytics. Organizations increasingly rely on analytics tools to improve workforce management, recruitment efficiency, employee retention, and overall productivity. HR analytics combines data analysis, statistical modeling, and visualization to help professionals make informed and objective decisions that align with business goals.

This study aims to explore the extent of adoption and usage of data analytics tools among HR professionals. Primary data was collected through a structured Google Form targeting individuals working in various organizational roles, industries, and company sizes. The collected responses were cleaned and analyzed using Python libraries such as Pandas, Seaborn, and SciPy to uncover patterns, relationships, and insights regarding tool adoption, perceived impact, and training needs.

Through statistical tests, including Chi-square analysis, the study found that company size significantly influences the need for analytics training, while no substantial relationship was observed between role or experience and tool adoption or impact. These findings highlight that while awareness of analytics in HR is growing, the effective implementation still depends on organizational scale and readiness. This project emphasizes the growing importance of analytical literacy in HR and how data-based decision-making is shaping the future of human resource management.

Literature Review:

The integration of data analytics into Human Resource Management (HRM) has transformed traditional HR practices into evidence-based, strategic functions. HR analytics, or people analytics, uses employee and organizational data to improve decisions in recruitment, retention, performance, and workforce planning. As Rasmussen and Ulrich (2015) note, analytics enables HR professionals to move beyond administrative duties toward strategic roles, reflecting a broader shift toward digital and data-driven management.

Research shows that organizations using HR analytics achieve better performance and decision accuracy. Bassi (2011) found that analytics-driven firms report higher productivity and profitability, while Fitz-enz (2010) noted its role in quantifying human capital and aligning talent strategies with business goals. However, adoption varies across industries, with smaller firms lagging due to limited resources, technology, and management support

A key challenge in adopting HR analytics is the limited readiness of professionals to use it effectively. Marler and Boudreau (2017) identified a lack of analytical skills as a major barrier, while Ramaswamy (2020) noted that resistance to change and data privacy concerns further hinder adoption. These issues are most pronounced in SMEs, which often lack the resources and training investments available to larger organizations.

Advancements in tools like Tableau, Power BI, and Python have made HR analytics more accessible and efficient. Minbaeva (2018) noted that these tools enable real-time monitoring of key HR metrics, enhancing transparency and decision-making. However, challenges such as limited analytical skills and organizational readiness still hinder full adoption. This study builds on prior research by examining how HR professionals use analytics tools, the challenges they face, and factors influencing their adoption.

Methodology:

This study follows a quantitative research design aimed at understanding the adoption, usage, and impact of data analytics tools among HR professionals. The process involved four stages: data collection, cleaning and preparation, analysis, and interpretation of results. This structured approach ensured the accuracy and validity of findings.

- **Data Collection:**

Primary data was collected through a structured Google Form distributed among HR professionals across various industries, company sizes, and experience levels. The questionnaire included multiple-choice and opinion-based questions focusing on tool adoption, impact assessment, and training needs. A total of 170 responses were received, providing a diverse and representative dataset for analysis.

- **Data Cleaning and Preparation:**

The responses were exported as a CSV file and processed using Python. Libraries such as Pandas, Seaborn, Matplotlib, and SciPy were used to clean, organize, and visualize the data. Missing and irrelevant entries were removed, columns were renamed for clarity, and categorical responses were standardized to prepare the dataset for analysis.

- **Data Analysis:**

Data visualization techniques were used to identify patterns in tool adoption and training needs. Chi-square tests of independence were conducted to test relationships between variables — Role vs Tool Adoption, Experience vs Tool Impact Rating, and Company Size vs Training Needs. The results indicated no significant relationship between role or experience and tool adoption, but a significant relationship between company size and training requirements ($p = 0.0228$), suggesting that larger organizations invest more in analytics capability development.

- Ethical Considerations

All responses were treated with confidentiality and anonymity. The data was used strictly for academic purposes, and participation was entirely voluntary.

In summary, the methodology combined structured data collection with statistical analysis, ensuring that the study remained objective, replicable, and academically reliable.

```
# Drop unnecessary columns
df_cleaned = df.drop(columns=['Name']) # Keep role/experience for analysis

# Drop rows with any missing values
df_cleaned = df_cleaned.dropna().reset_index(drop=True)

# Inspect cleaned data
print("--- Cleaned Data Head ---")
print(df_cleaned.head())
print("\n--- Data Info ---")
df_cleaned.info()
```

Data cleaning code in python (Figure 1.1)

<https://docs.google.com/forms/d/e/1FAIpQLSfKqjFZ5SsbA-9jsxySmrT6gQ4hy0RhR5fnlJxOJgtcYcCgfQ/viewform?usp=dialog>

- Analytical Tools and Techniques:

The analysis was performed using Python programming language with dedicated libraries:

- Pandas: Used for dataset loading, cleaning, and transformation.
- Matplotlib & Seaborn: Used for generating all descriptive visualizations (pie charts, bar charts, stacked bar charts).
- Descriptive Analysis: Frequency distributions and percentages are the primary tools to summarize the data.

- Inferential Analysis: Cross-tabulation and χ^2 (Chi-square) tests will be used to determine the statistical significance of relationships between key categorical variables.

Importing data and libraries in python (Figure 1.2)

Field Work Description

The fieldwork for this study was conducted through a Google Form survey designed to gather insights from HR professionals regarding the use and perception of data analytics tools in their organizations. The questionnaire covered multiple areas such as designation, experience level, company size, tool adoption, frequency of use, perceived impact, challenges, and training requirements. The form was shared digitally, ensuring accessibility across diverse sectors and organizations. A total of 170 responses were received, encompassing HR executives, managers, analysts, and business partners from organizations of varying scales.

After collecting responses, the data was exported in CSV format and processed using Python libraries (Pandas, Matplotlib, Seaborn, and SciPy). The field data underwent a thorough cleaning process:

- Removal of incomplete or inconsistent responses.
- Renaming and restructuring of columns for clarity.
- Categorization of variables for analytical consistency.
- Preparation of data for visualization and statistical testing.

Subsequent visual and statistical analyses were performed to identify patterns and relationships among the variables. Three major relationships were tested using Chi-square tests of independence:

- Role and Tools Adoption
- Experience and Tool Impact Rating
- Company Size and Need for Training

Observation:

Initial visualizations revealed interesting patterns across different demographic and organizational categories.

Tool Adoption by Role (Figure 1.3)

- **Tool Adoption by Role:**

The count plot indicated that HR managers and analysts were more likely to adopt analytics tools compared to general HR executives. However, the Chi-square test ($\chi^2 = 3.4597$, $p = 0.9023$) showed no significant relationship between the respondent's role and their adoption of analytics tools. This implies that tool adoption is relatively consistent across different HR roles.

Tool Impact by Experience (Figure 1.4)

- **Tool Impact by Experience:**

The visualization comparing experience levels with impact ratings showed that professionals with greater experience tended to rate analytics tools slightly higher in terms of impact. Yet, the Chi-square test ($\chi^2 = 13.7184$, $p = 0.3190$) suggested no significant relationship between experience and perceived impact, indicating that appreciation for analytics tools is not dependent on tenure alone.

Training needs by company size (Figure 1.5)

- **Training Needs by Company Size:**

The plot depicting company size versus training needs showed that employees from larger organizations more frequently expressed the need for structured analytics training. This finding was statistically supported, with a significant relationship ($\chi^2 = 17.7952$, $p = 0.0228$) observed between company size and training needs.

➤ Hypothesis Testing and Verification:

Hypothesis 1:

H0: There is no significant relationship between tool adoption and role in HR.

--- Contingency Table: Role vs Tools Adoption ---			
Tools_Adoption	No	Planning to adopt soon	Yes
Role			
Compensation & Benefits Specialist	6	4	21
HR Analyst/Specialist	10	4	25
HR Manager/Director	7	6	30
Learning & Development Professional	5	1	14
Talent Acquisition/Recruiter	5	4	28
Chi-Square Statistic = 3.4597, p-value = 0.9023			
Result: No significant relationship between Role and Tools Adoption			

Role vs Tools Adoption (Table 1.1)

Test result: The chi-squared test yielded a high p-value of 0.9023. Hence we fail to reject H0.

Hypothesis 2:

H0: There is no significant relationship in tool impacts and experience.

--- Contingency Table: Experience vs Tool Impact ---					
Tool_Impact_Rating	1	2	3	4	5
Experience					
10+ years	2	8	2	14	5
2-5 years	2	5	16	26	19
6-10 years	2	4	8	13	8
Less than 2 years	0	5	6	15	10
Chi-Square Statistic = 13.7184, p-value = 0.3190					
Result: No significant relationship between Experience and Tool Impact Rating					

Experience vs Tool Impact Rating (Table 1.2)

Test result: The chi squared test yielded a p-value of 0.3190

Hence we fail to reject H0.

Hypothesis 3:

H0: There is no significant relationship between training needs and company size.

```
--- Contingency Table: Company Size vs Needs Training ---
Needs_Training  No  Unsure  Yes
Company_Size
0-50             8      8    25
1001-5000        8      5    16
201-1000         10     9    11
51-200           13     10    17
More than 5000   7      16     7

Chi-Square Statistic = 17.7952, p-value = 0.0228
Result: Significant relationship between Company Size and Training Needs
```

Company size vs Training Needs (Table 1.3)

Test result: The chi-squared test revealed a low p-value of 0.0228

Hence we reject H0.

Analysis:

The field results collectively highlight that while analytics tools are recognized as valuable across the HR domain, their adoption and effective utilization depend on

organizational infrastructure and capacity rather than individual factors like role or experience. The significant correlation between company size and training needs suggests that larger organizations are more capable of investing in data-driven HR systems and providing the necessary training to employees. Smaller organizations, on the other hand, may face limitations in both access to technology and resources for capacity building.

The findings reinforce observations from previous research that HR analytics adoption is not only a technological shift but also an organizational transformation requiring investment, awareness, and skill development. Visual insights from the dataset demonstrate growing awareness and willingness among HR professionals to engage with analytics, yet underline the gap in training and structured learning.

Overall, the fieldwork confirms that while HR analytics is gaining acceptance, there remains a pressing need for greater emphasis on training and integration of analytical tools—particularly in mid-sized and emerging organizations seeking to modernize their HR practices.

Visualization and dashboard description:

Horizontal Bar (Figure 1.6)

Respondents

This horizontal bar simply shows the total number of survey respondents, which is 170.

Stacked Bar (Figure 1.7)

Experience

This bar chart displays the distribution of respondents based on years of HR experience.

68 respondents have **2–5 years** of experience (the largest group).

36 respondents have **less than 2 years**.

35 respondents have **6–10 years**.

31 respondents have **over 10 years** of experience.

Horizontal Bar (Figure 1.8)

Using Data Analytical Tools

This horizontal bar chart illustrates the level of adoption of data analytics tools among HR professionals.

118 respondents (majority) reported that they **currently use** analytics tools.

33 respondents indicated they **do not use** such tools.

19 respondents mentioned they are **planning to adopt** them soon.

Line Graph (Figure 1.9)

Tools use more frequently

This chart displays which analytics tools are used most frequently by HR professionals.

- **Excel/Spreadsheets** are used **most frequently (80 respondents)** showing it's still the most common tool.
- **Microsoft Power BI (28)** is the second most used.

- **Google Analytics/Data Studio (18)** and **Tableau (20)** are used moderately.
- **Python/R (13)** and **HR-specific tools (11)** are used least.

Industries (Figure 1.10)

Industries

This graph shows which industries use analytics tools the most.

Technology/Software industry dominates with **77 respondents**, meaning it uses analytics tools most widely.

Finance/Banking (22), **Healthcare (21)**, **Manufacturing/Retail (20)**, and **Education (18)** use them moderately.

Non-profit organizations (12) use them the least.

Bubble Chart (Figure 1.11)

Challenges Faced

This graph highlights the major challenges HR teams face while using data analytics tools.

- **Biggest challenges:**
 - Data privacy and compliance issues
 - Lack of technical skills/training
- **Moderate challenges:**
 - High cost of tools/licenses
 - Poor data quality or accessibility
- **Smaller challenges:**
 - Resistance from the team
 - Other challenges

Dashboard (Figure 1.12)

Conclusion:

The study on Data Analytics Tools Used by HR Professionals revealed that while awareness and usage of analytics tools are increasing, their adoption remains uneven across roles and organizations. The statistical analysis indicated no significant relationship between role or experience and tool adoption; however, a notable link was found between company size and the need for training. This suggests that larger organizations are more inclined to invest in analytics capacity building, whereas smaller firms may lack sufficient resources or awareness.

Recommendations

- **Encourage Training Initiatives:** Organizations should prioritize regular workshops and certifications to enhance HR professionals' analytical skills.
- **Promote Tool Integration:** Companies must integrate analytics tools into HR workflows to drive data-based decision-making.
- **Invest in Scalable Solutions:** Smaller organizations should consider affordable, user-friendly analytics platforms to improve adoption.
- **Continuous Evaluation:** Regular assessments should be conducted to measure the impact of analytics adoption and identify further areas of improvement.

Department: Bsc. Data Science

Name of the Mentor: Mr. Adarsh Dubey

Title/Heading of Field Project: Field Analysis of Data Analytics Tools used by HR Professionals

Brief description of FP carried out:

Dates of FP:

Was your internship experience related to your major area of study?

- Yes, to a large degree
- Yes, to a slight degree
- No, not related at all

Indicate the degree to which you agree or disagree with the following statements.

This experience has:	Strongly Agree	Agree	No opinion	Disagree	Strongly Disagree
Given me the opportunity to explore a career field	✓				
Allowed me to apply classroom theory to practice		✓			
Helped me develop my decision-making and problem-solving skills	✓				
Expanded my knowledge about the work world before permanent employment	✓				

Helped me develop my written and oral communication skills		✓			
Provided a chance to use leadership skills (influence others, develop ideas with others, stimulate decision-making and action)		✓			
Expanded my sensitivity to the ethical implications of the work involved		✓			

Made it possible for me to be more confident in new situations		✓			
Given me a chance to improve my interpersonal skills		✓			
Helped me learn to handle responsibility and use my time wisely		✓			
Helped me discover new aspects of myself that I didn't know existed before		✓			
Helped me develop new interests and abilities		✓			
Helped me clarify my career goals	✓				
Allowed me to acquire information and/ or use equipment not available at my Institute		✓			
Allowed me to realize socio-economic issues in the society		✓			

- In the Institute FP program, faculty members are expected to be mentors for students. Do you feel that your faculty mentor served such a function? Why or why not?
- How well were you able to accomplish the initial goals, tasks and new skills that were set down in your learning contract? In what ways were you able to take a new direction or expand beyond your contract? Why were some goals not accomplished adequately?

- In what areas did you most develop and improve?
- What has been the most significant accomplishment or satisfying moment of your FP?
- What did you dislike about the FP?
- Considering your overall experience, how would you rate this FP? (Circle one). –
Satisfactory/ Good/ Excellent
- Give suggestions as to how your FP experience could have been improved. (Could you have handled added responsibility? Would you have liked more discussions with your professor concerning your FP? Was closer supervision needed? Was more of an orientation required?)
